GhostVolt Announces New Encryption Platform

GhostVolt Encryption for Teams offers simple, secure, and scalable solutions.

Cambridge, MA (February 11, 2019) GhostVolt today announced the release of a smart, simple encryption solution for collaborative workflow with multi –layered, customizable permissions for protecting intellectual property and preserving privacy.

Every organization faces a critical problem today regarding how to handle data. It is very difficult to easily secure and protect private data from those intending to steal digital information, while still preserving the ability of employees to access the data to do their jobs. GhostVolt, with headquarters in Cambridge, MA, and Newcastle, UK, is a new startup that offers a solution to that exact problem with the launch of its innovative software, GhostVolt Encryption for Teams. Lead Developer, Steve Beckett, explains: "GhostVolt leverages the security of enterprise level AES encryption in a simple platform that is easily scalable to fit any type of business." AES encryption will keep data secured at rest, and, when in transit along with a complete user management system allowing full control of user permissions.

The multi-level permissions manager can be fully customized for the unique needs of the team or business structure. Users with higher administrative access can review or control the movement and status of any digital asset, as well gather full insights into users, with detailed reports always available. GhostVolt is the perfect solution for small-to-medium businesses, or security-minded individuals.

GhostVolt offers performance and simplicity that works, by providing an easy-to-manage, easy-to-use, smart encryption solution, built for collaboration and teamwork. GhostVolt allows users to create teams and assign roles to team members. Team leaders can set up shared folders, and decide who can add, edit, or view any data by assigning customizable permissions. Head of Design & UX, James Eden adds: "We have worked hard to build a simple and usable environment that is familiar to users, so GhostVolt will fit in with any type of collaborative workflow."

GhostVolt uses enterprise level AES encryption to keep data secured at rest and in transit, taking care of encryption at every point, automatically. With no back doors, you can be sure any data is invisible to bad actors, from simple hackers, to cyber-warriors that are practicing industrial espionage and theft of intellectual property. GhostVolt enables consumers to protect their data and their business from privacy breaches and the significant cost of repairing any damage that can be caused by a breach.

GhostVolt Encryption for Teams will be available in single user, home, and business editions. Single and home users will enjoy the full benefits of 256-bit AES encryption, sharing encrypted files and full control over their own encryption repository, while the business edition provides a complete user management system allowing full control of user permissions. GhostVolt's multi-level permissions manager can be fully customized for the needs of a collaborative team or business structure. Users with higher administrative access can review or control the movement and status of any digital asset, as well gather full insights into the users, with detailed, real-time reports.

As a result of the latest technology offered by GhostVolt, organizations can improve their ability to handle the many obligations that come with managing valuable and sensitive data. Because GhostVolt is designed within the new regulatory environment, reporting tools are even more sensitive and customizable, and compatible with all current industry standards related to security. Specific industry security standards, such as HIPAA and other compliance measures, have informed the development of GhostVolt products to assist any organization with meeting the latest compliance expectations.
